

The first application for HTML and other coding languages that comes to mind is its usage for the creation of a library website. A website for a library is an important tool to help them stay connected to their clients by providing information and updates. A website can also be used to share the library's collection digitally although this requires a much more advanced knowledge of programming.

It is very often that libraries will conduct surveys to learn the opinions of their users so using html forms to conduct surveys and retrieve information is helpful. The forms can be sent to patrons via email to ask them about recent changes to the library or about an event that they recently attended.
